

Project Development Phase – User Acceptance Testing

Project: ShopEZ Online Shopping Platform

Date: 04 July 2026

Testing Scope

The ShopEZ platform testing scope includes customer registration and login, product browsing, shopping cart functionality, secure payment processing, order placement, order tracking, seller dashboard operations, notifications, product reviews, discount systems, and responsive layouts for mobile and desktop devices. The testing phase ensures that all customer and seller workflows function correctly and securely under different conditions.

Sample UAT Cases

1. Verify that customers can successfully register, log in, and access their accounts.
2. Verify that users can search products using categories, filters, and keywords.
3. Verify that customers can add products to the shopping cart and update quantities.
4. Verify that secure checkout and payment processing work correctly for multiple payment methods.
5. Verify that customers receive instant order confirmation and shipment notifications.
6. Verify that sellers can upload products, update inventory, and manage orders efficiently.
7. Verify that customers can track delivery progress and request returns if necessary.
8. Verify that unauthorized users cannot access admin-only or seller-only routes.
9. Verify that customer reviews and ratings are displayed correctly for products.
10. Verify that the website interface works properly on desktop, tablet, and mobile devices.

Performance Testing

Performance testing ensures that ShopEZ can handle multiple users simultaneously without slowing down. Product searches, order placement, and payment transactions should execute quickly even during high traffic conditions. Database queries and APIs are tested for speed, reliability, and stability.

Security Testing

Security testing focuses on authentication systems, encrypted passwords, secure APIs, and payment gateway protection. The testing process ensures that customer data, transaction details, and seller information remain protected against unauthorized access, cyber threats, and online fraud attempts.

User Experience Testing

User experience testing verifies that the platform is simple, responsive, and easy to use. Customers should be able to browse products, place orders, and track deliveries without confusion. Sellers should easily manage inventory, orders, and customer interactions through the dashboard.

Sign-off Criteria

The ShopEZ platform will be approved for deployment only if all major shopping workflows, authentication systems, payment gateways, seller dashboards, and order tracking features function correctly without critical defects. The application must provide stable performance, responsive layouts, secure transactions, and reliable data storage before final release.
